

The screenshot shows a VS Code editor with a file explorer on the left and a terminal at the bottom. The file explorer shows a project named 'SOA' with a subdirectory 'api_session_01' containing files like 'requirements.txt', 'app.py', and 'pyvenv.cfg'. The 'app.py' file is open in the editor, showing the following code:

```
1 from flask import Flask
2 app = Flask(__name__)
3 @app.route("/")
4 def index():
5     return {"message": "Hello, API"}
6 if __name__ == "__main__":
7     app.run(host = "127.0.0.1", port = 5000, debug=True)
```

The terminal at the bottom shows the output of running 'python app.py' in a virtual environment. It displays messages about serving the Flask app, debug mode being on, and the server running on http://127.0.0.1:5000. It also shows a warning about using a development server and a message about the debugger being active. Finally, it shows the output of a GET request to the root URL, which returns a 200 status code.

The screenshot shows a Windows terminal window with the following output:

```
Microsoft Windows [Version 10.0.26200.9445]
