

The image shows a Visual Studio Code editor with a project named 'SOA'. The Explorer sidebar on the left shows the file structure, including a virtual environment '.venv' and files like 'app.py', 'requirements.txt', and 'bai1.docx'. The main editor window displays the code for 'app.py', which is a Flask application with two routes: a GET route for '/health' that returns a JSON status 'ok', and a POST route for '/echo' that echoes the request data. The code is as follows:

```
1 from flask import Flask, jsonify, request
2 app = Flask(__name__)
3 # GET /health - kiểm tra server còn sống
4 @app.route("/health", methods=["GET"])
5 def health():
6     return jsonify({"status": "ok"}), 200
7 # POST /echo - trả lại cái client gửi
8 @app.route("/echo", methods=["POST"])
9 def echo():
10     data = request.get_json(silent=True) or {}
11     return jsonify({"you_sent": data}), 200
12 if __name__ == "__main__":
13     app.run(host="127.0.0.1", port=5000, debug=True)
14
```

Below the code editor, the 'Terminal' tab is active, showing the command prompt output. The user has navigated to the 'api_session_01' directory and run 'python app.py'. The output shows the server starting on http://127.0.0.1:5000 with debug mode on. A warning message states: 'WARNING: This is a development server. Do not use it in a production deployment. Use a production WSGI server instead.' The user then runs a curl command to test the health endpoint:

```
E:\SOA\api_session_01>curl -i http://127.0.0.1:5000/health
HTTP/1.1 200 OK
Server: Werkzeug/3.1.8 Python/3.12.3
Date: Fri, 11 Sep 2026 13:16:45 GMT
Content-Type: application/json
Content-Length: 21
Connection: close

{
  "status": "ok"
}
```

The terminal output shows the response from the health endpoint. The user then runs another curl command to test the echo endpoint:

```
E:\SOA\api_session_01>curl -X POST http://127.0.0.1:5000/echo -H "Content-Type: application/json" -d '{"name": "An", "age": 21}'
{"you_sent": {"age": 21, "name": "An"}}
```

The terminal output shows the response from the echo endpoint, which is a JSON object containing the data sent in the request body.
